OPEN DOMAIN MODEL ORDER REDUCTION TOOLS FROM OUR GROUP AT MIT

1. August 2009. Squid. Open source Matlab tool for the generation of reduced order linear system models from available transfer function data points. Based on quasi-convex relaxation of a system identification problem subject to stability and passivity constraints. http://www.mit.edu/~dluca/squid/
2. February 2010, SMORES: Simulation and Model Order Reduction of Electrical Systems. Public domain Matlab circuit simulator that reads spice-like netlists and performs several types of analysis. http://bnbond.com/software/smores/
3. March 2010, STPWL: Stabilized Trajectory Piece-Wise Linear model reduction. This is a Matlab toolbox for stable trajectory piecewise linear model order reduction of nonlinear systems. http://bnbond.com/software/stpwl/stpwl.zip
4. March 2010, public domain open source Matlab code for generating guaranteed stable compact models of nonlinear analog circuit blocks from input/output data (e.g. low noise amplifiers, mixers, or power amplifiers). http://bnbond.com/software/stins/
5. June 2010, Matlab compact modeling code. The tool takes a S-parameter or Z-parameter file in `.snp' touchstone format or .mat file in Matlab and generates a compact dynamical model in verilogA. The code incorporates binary search to find the minimum system order for a given error bound. Key contribution: using sum of squares to enforce stability and passivity constraints allowing an order of magnitude faster performance than our previous quasi-convex based tool. http://web.mit.edu/zohaib/www/#software
6. December 2013, Spectral projector computation, index checking and system decomposition for linear DAEs (or linear time-invariant descriptor systems). http://web.mit.edu/z_zhang/www/codes_data.htm
